

ARMFIX

Shoulder orthosis

SRT 218

Indications

Used for light contusions, sprains, subluxations, bursitis, rotator cuff injury and post-operative support.

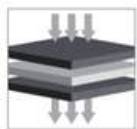

Description

This orthosis is an elastic support for the shoulder joint. It has thermal insulating properties to relax the muscles. It covers the shoulder and the arm and is secured by a strap under the opposite armpit. The orthosis can be worn on the left or right shoulder.

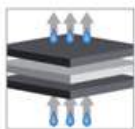

It can be adjusted to the optimal compression and it can be used in sports activities that overload the shoulder joint. This orthosis can be used both to treat minor ailments and for recovery in the post-immobilisation / post-operative period.

Composition

Three-layer laminated textile behaves like a moisture regulator, wicking the moisture in an outward direction.

Air Transfer

Water Transfer

- Available in Black

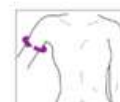

- Adjustable fastening strap so orthosis can be used for either left or right side

- fastening band under the opposite armpit with hygiene protection sleeve
